The second one can do the same for a view, a function, a trigger, a stored procedure or an event.The third one is used to display all of the objects, queries, views, tables, triggers or functions that the database uses. The last one has four options: the database is locked, the table is locked, the database can be read-only or the table can be read-only. The application has four modes, one of which is the default mode: 'Console'. This allows you to access the object that is edited in the console, that is in a text window, with the properties that you want to configure, very fast. If you select 'System' the program will access the database server directly, but it will not display any of the objects and will not have the option to edit any objects.
